LAND ACKNOWLEDGMENT

The Canadian Society of Nephrology Board of Directors has a commitment to diversity and inclusion.

We acknowledge that we are meeting on ancestral land that has been inhabited by Indigenous peoples from time immemorial. We are meeting virtually, so I would like to acknowledge that the Indigenous peoples are the traditional stewards of the lands and waters where each of us attends this meeting.

Ana Konvalinka
PhD, MD, FRCPC
Toronto, ON

Dr. Ana Konvalinka was recruited in 2015, as a transplant nephrologist and a Clinician Scientist at Toronto General Hospital, University Health Network. She is an Assistant Professor at the University of Toronto. Dr. Konvalinka completed medical studies at the University of Ottawa in 2003. She then completed internal medicine and nephrology training in Toronto in 2008. She subsequently embarked on a PhD in basic science at the University of Toronto. Her PhD thesis addressed the effect of angiotensin II on the proteome of primary human proximal tubular cells, and the relevance of this effect in vivo. Following completion of her PhD in 2013, she went on to complete the clinical kidney transplant fellowship at Toronto General Hospital. Her main clinical and research interests are in antibody-mediated rejection and kidney allograft fibrosis. She utilizes systems biology approaches and proteomics to enhance the understanding of the mechanisms, derive novel markers and to repurpose drugs for treatment of kidney disease. Dr. Konvalinka is the director of the Multi-Organ Transplant biobank for kidney, pancreas, and liver transplant programs. She is also the co-director of the Drug Discovery research group. She has received international research awards (the Human Proteome Project (2016), the American Society of Transplantation Faculty-Development Research Grant (2016) and the Advances in Organ Transplantation Award (2015)) and national research awards (Canadian Society of Nephrology New Investigator Lectureship (2017) and the KRESCENT New Investigator Award (2016)).

CSN Webinar

Antibodies and their Interactions with the Kidney Allograft Tissue in Antibody Mediated Rejection

Dr. Ana Konvalinka
Transplant Nephrologist, Clinician Scientist, University Health Network
Assistant Professor, University of Toronto
Senior Scientist, Toronto General Hospital Research Institute
Director, Ajmera Transplant Centre Multi-organ Transplant Biobank

Dec 13, 2022

OBJECTIVES

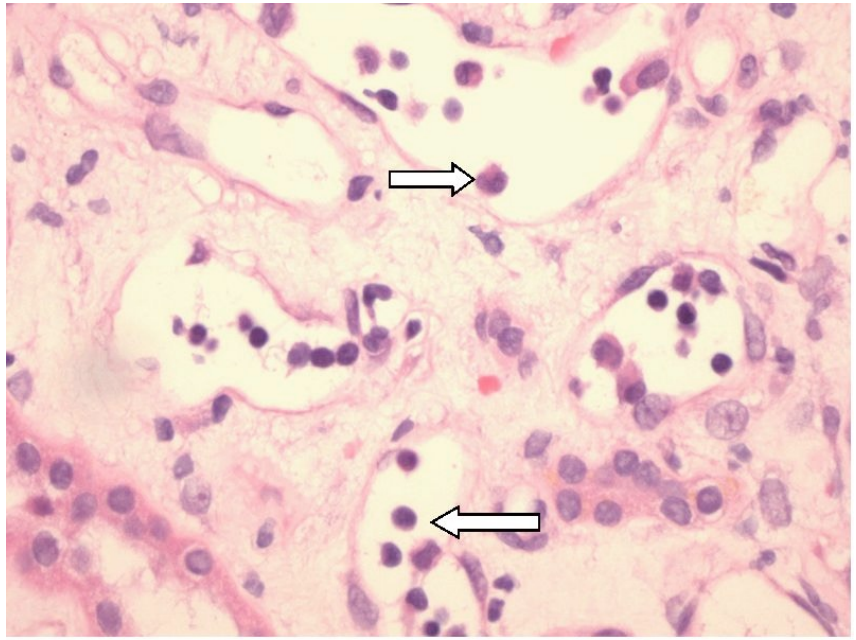
1. Provide an overview of antibody-mediated rejection in the kidney allograft
2. Describe the proteome changes in kidney glomeruli and tubulointerstitium in early antibody-mediated rejection
3. Review the importance of studying the extracellular matrix in the kidney
4. Describe novel approaches to delineate the biochemical features and roles of donor-specific antibodies in antibody-mediated rejection

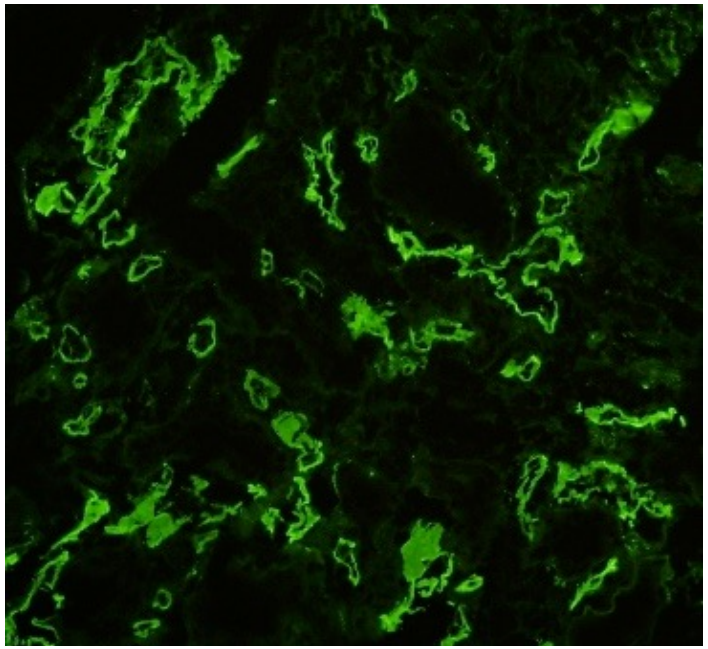
DISCLOSURES

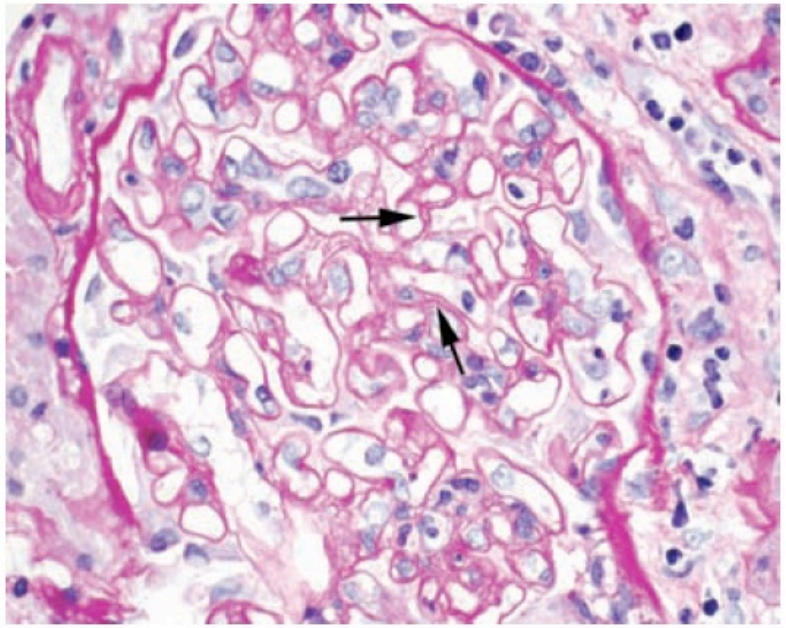
- Baxter (2022) - honoraria
- Promega - Academic access program

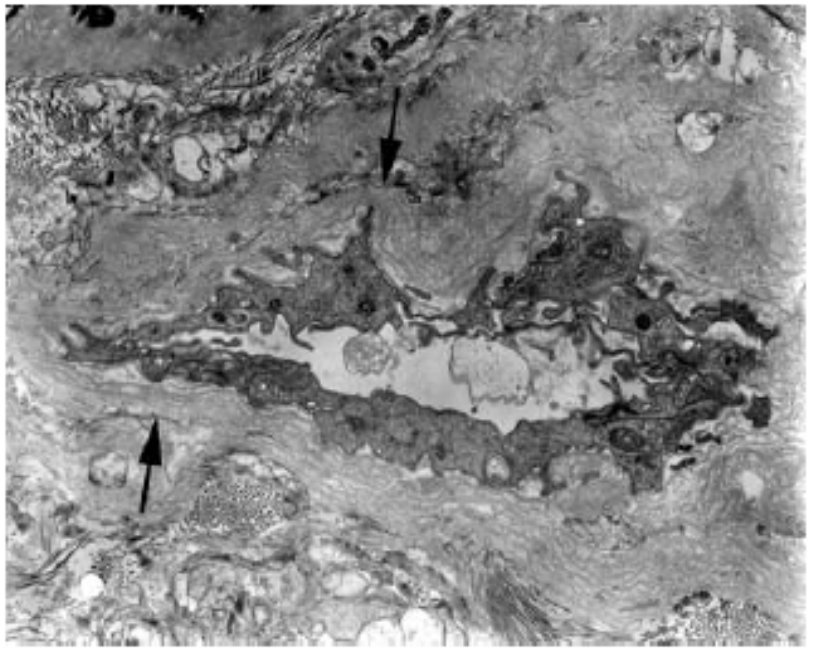
CASE 1

- 33F with ESKD due to IgA nephropathy
- Received a living donor kidney transplant 2 years previously
- Admits to non-adherence in the last few months; otherwise well
- Blood work reveals SCr of 210µmol/L from a base line of 120µmol/L
- US is normal
- New DSA against DQ6 is detected







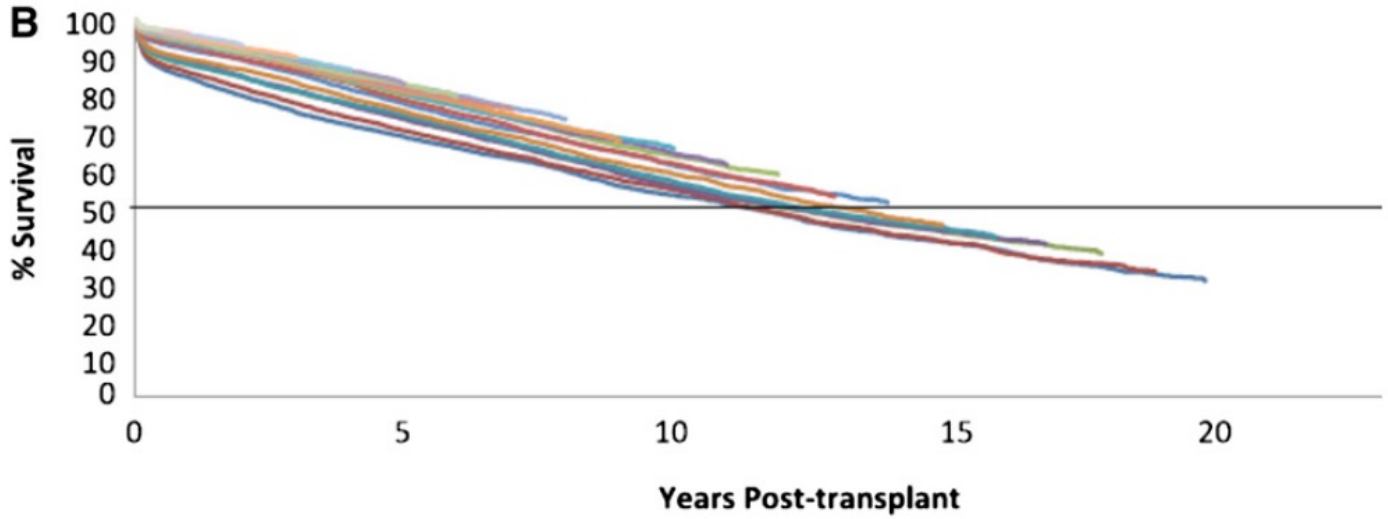


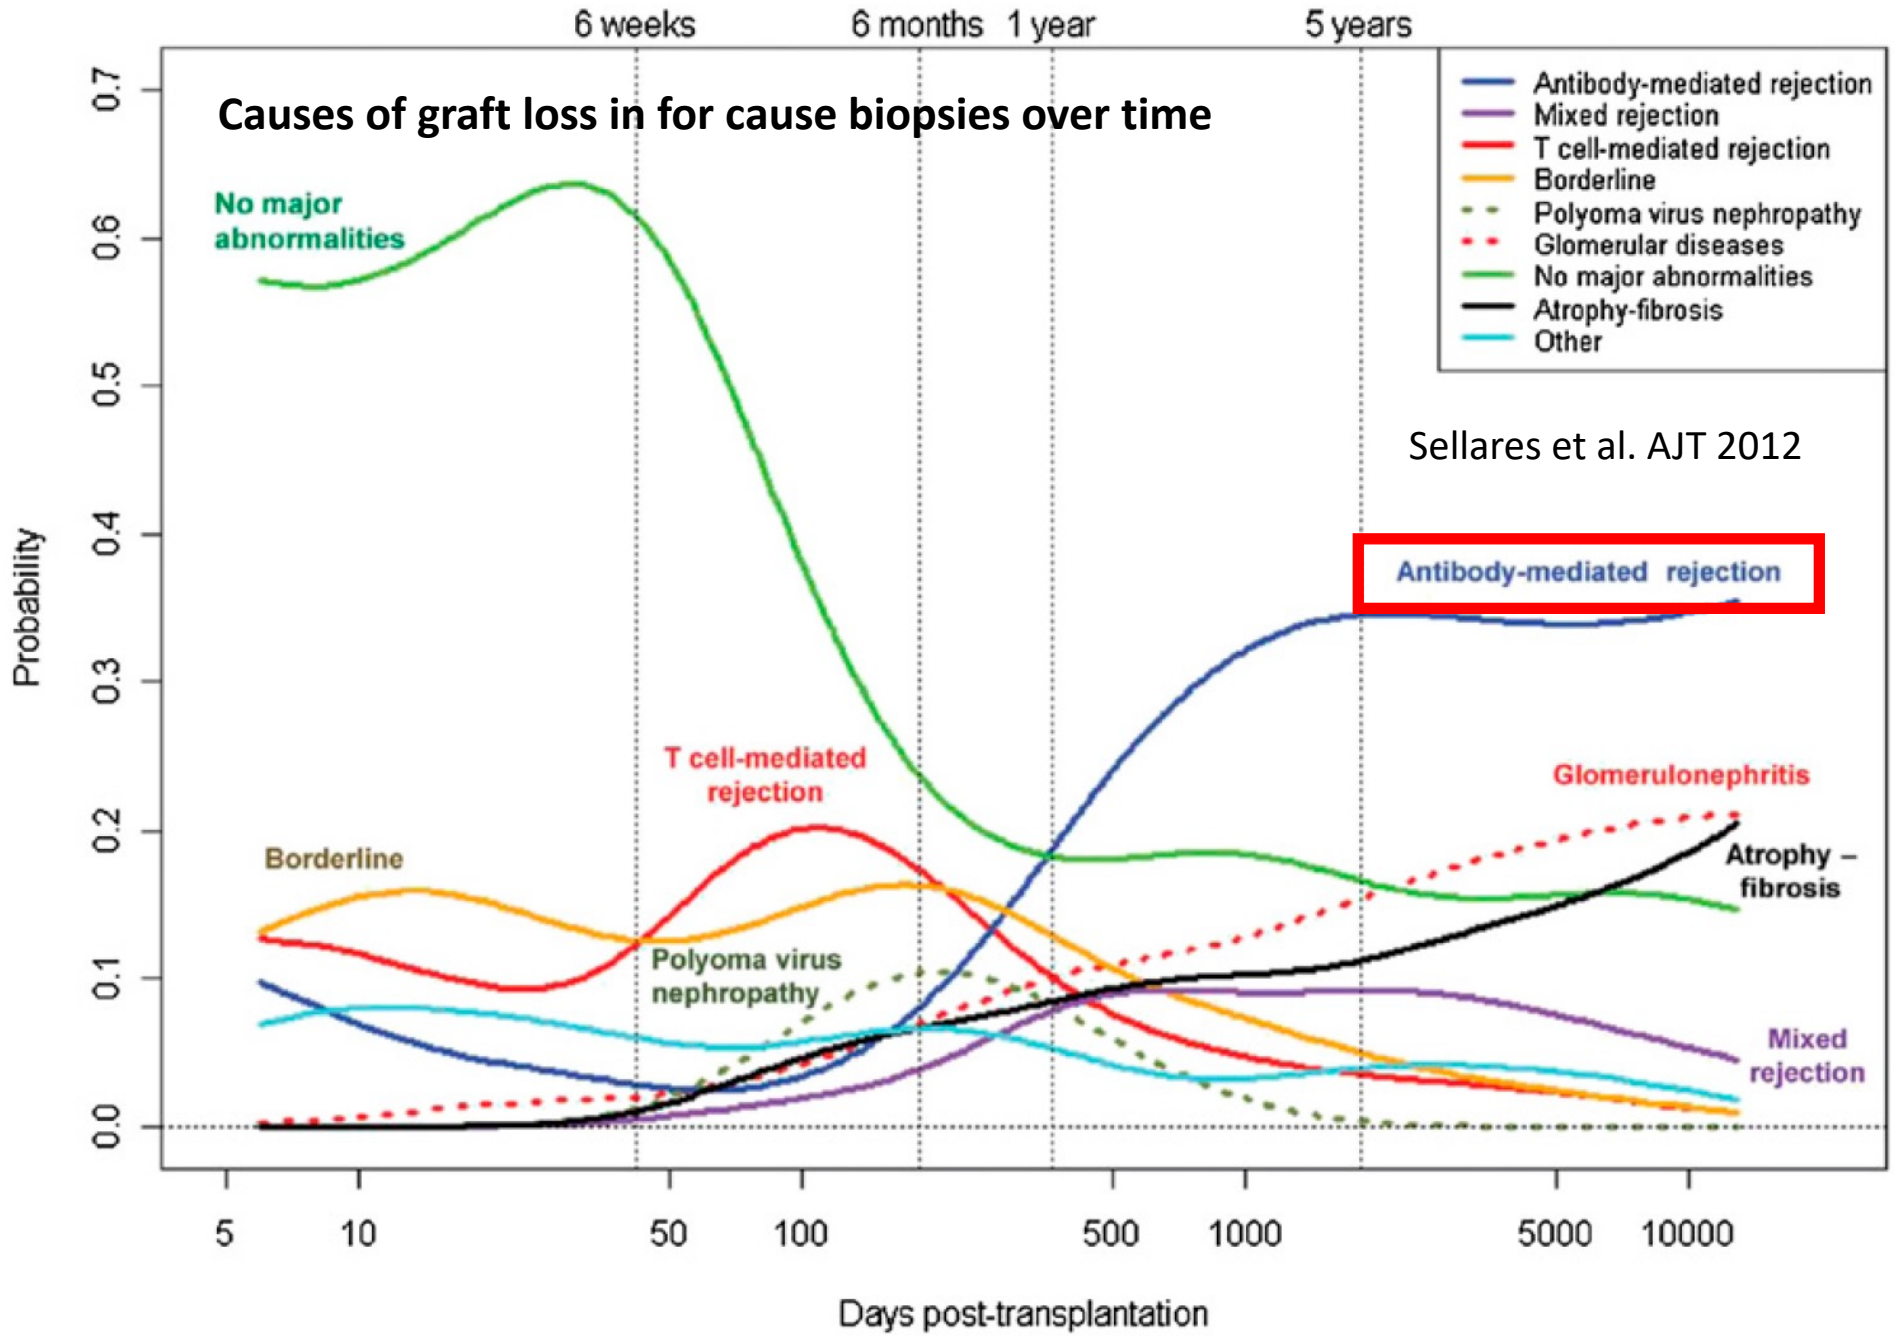
Overview

- Background
- Story #1 – Kidney glomerular and tubulointerstitial proteome in AMR
- Story #2 – Novel models to study AMR
- Story #3 – Assess circulating non-HLA antibodies in patients with AMR
- Future directions

BACKGROUND

- Kidney transplantation is the best treatment for end stage kidney disease
- The rates of early kidney allograft rejection have diminished
- However, long-term allograft survival has not changed significantly (Lamb et al. AJT 2011)





Causes of graft loss in for cause biopsies over time
6 weeks
6 months
1 year

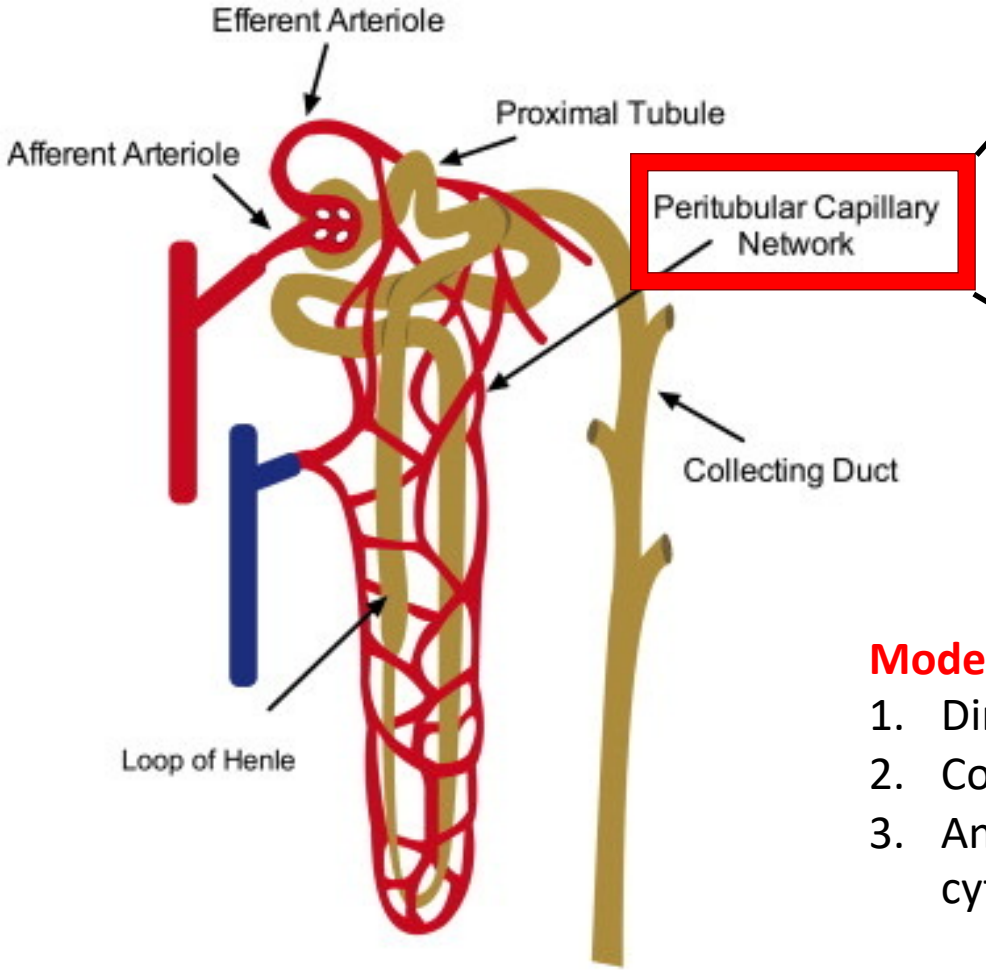
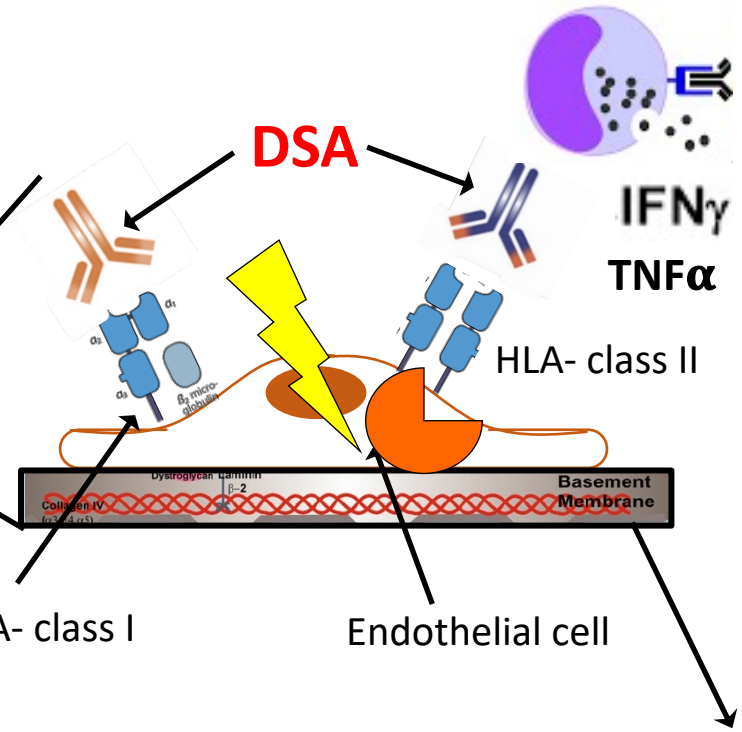
Pathophysiology of AMR

UHN Ajmera Transplant Centre





FcR interaction

Transplant glomerulopathy

Modes of injury by DSA:

1. Direct injury
2. Complement activation
3. Antibody-dependent cell-mediated cytotoxicity

Donor Specific Antibodies (DSA) – as a causal agent in AMR

- Class II HLA DSA appear more commonly after transplant and are associated with worse outcomes
- However, even in the presence of these antibodies, 30-60% of patients will do well
  - Yamamoto et al. *Transplantation* 2016
  - Matignon et al. *PLoS ONE* 2017
  - Heilman et al. *Transplantation* 2014
  - Lefacheur et al. *J Am Soc Nephrol* 2016
- Other DSA+ patients will experience AMR, TG and graft loss
  - Everly et al. *Am J Transplant* 2009, *Transplantation* 2010
  - DeVos et al. *Kidney Int* 2012
  - Willicombe et al. *Transplantation* 2012
  - Yabu et al. *Transplantation* 2011
- 40-60% of all AMR cases have no detectable DSA
  - Senev A, et al. Am J Transplant (2019) 19(3):763–80.
  - Bestard O, Grinyó J. Am J Transplant (2019) 19(3):952–3.
  - Koenig A, et al. Nat Commun (2019) 10(1):5350.

Gaps in knowledge

- The role of kidney tissue in antibody mediated rejection is poorly understood
- The most important non-HLA antibodies to be included in routine clinical monitoring are unknown
- Determination of pathogenic DSA is elusive
- Effective therapies are lacking

Gaps in knowledge

- The role of kidney tissue in antibody mediated rejection is poorly understood

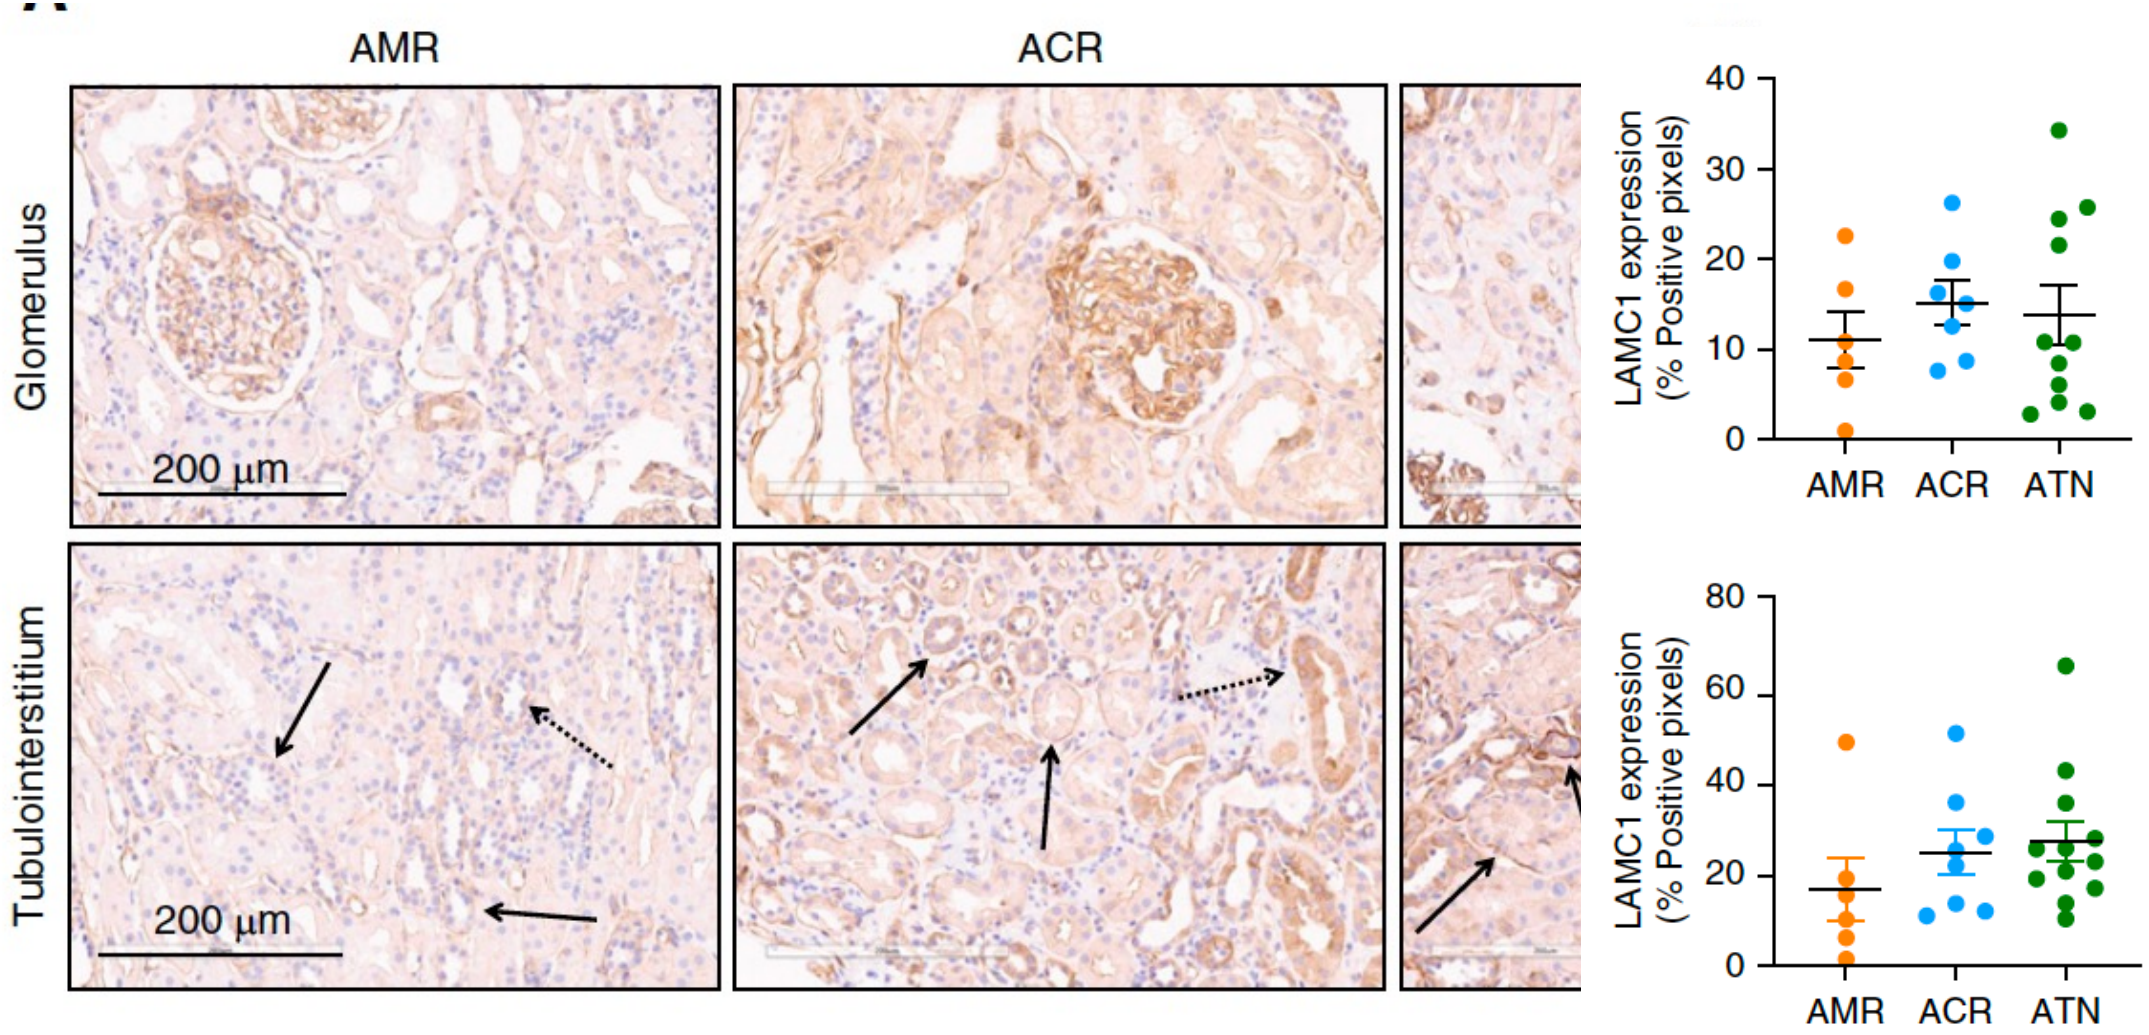
LAMC1 Immunohistochemistry



Clotet-Freixas S, *et al.*, *JASN*, 2020

Glomerular and tubulointerstitial proteome in AMR

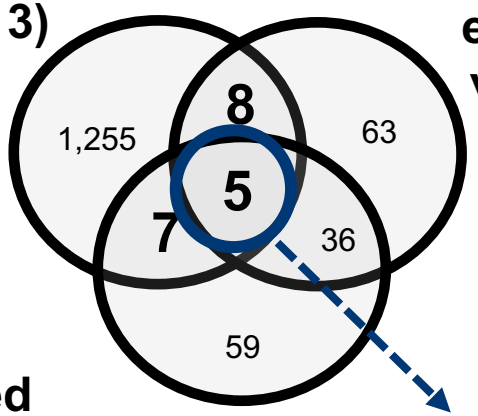
- Basement membrane and extracellular matrix proteins were significantly decreased in both compartments, even in the absence of histological lesions consistent with extracellular matrix remodeling

- Some proteins (e.g. LAMC1) were common to both compartments, while others were compartment specific

Glomerular AMR: External data set analysis

1,275 genes differentially expressed in AMR biopsies (Sellares et al. *Am J Transplant* 2013)

112 proteins differentially expressed in AMR vs ATN Glomeruli



107 proteins differentially expressed in AMR vs ACR Glomeruli

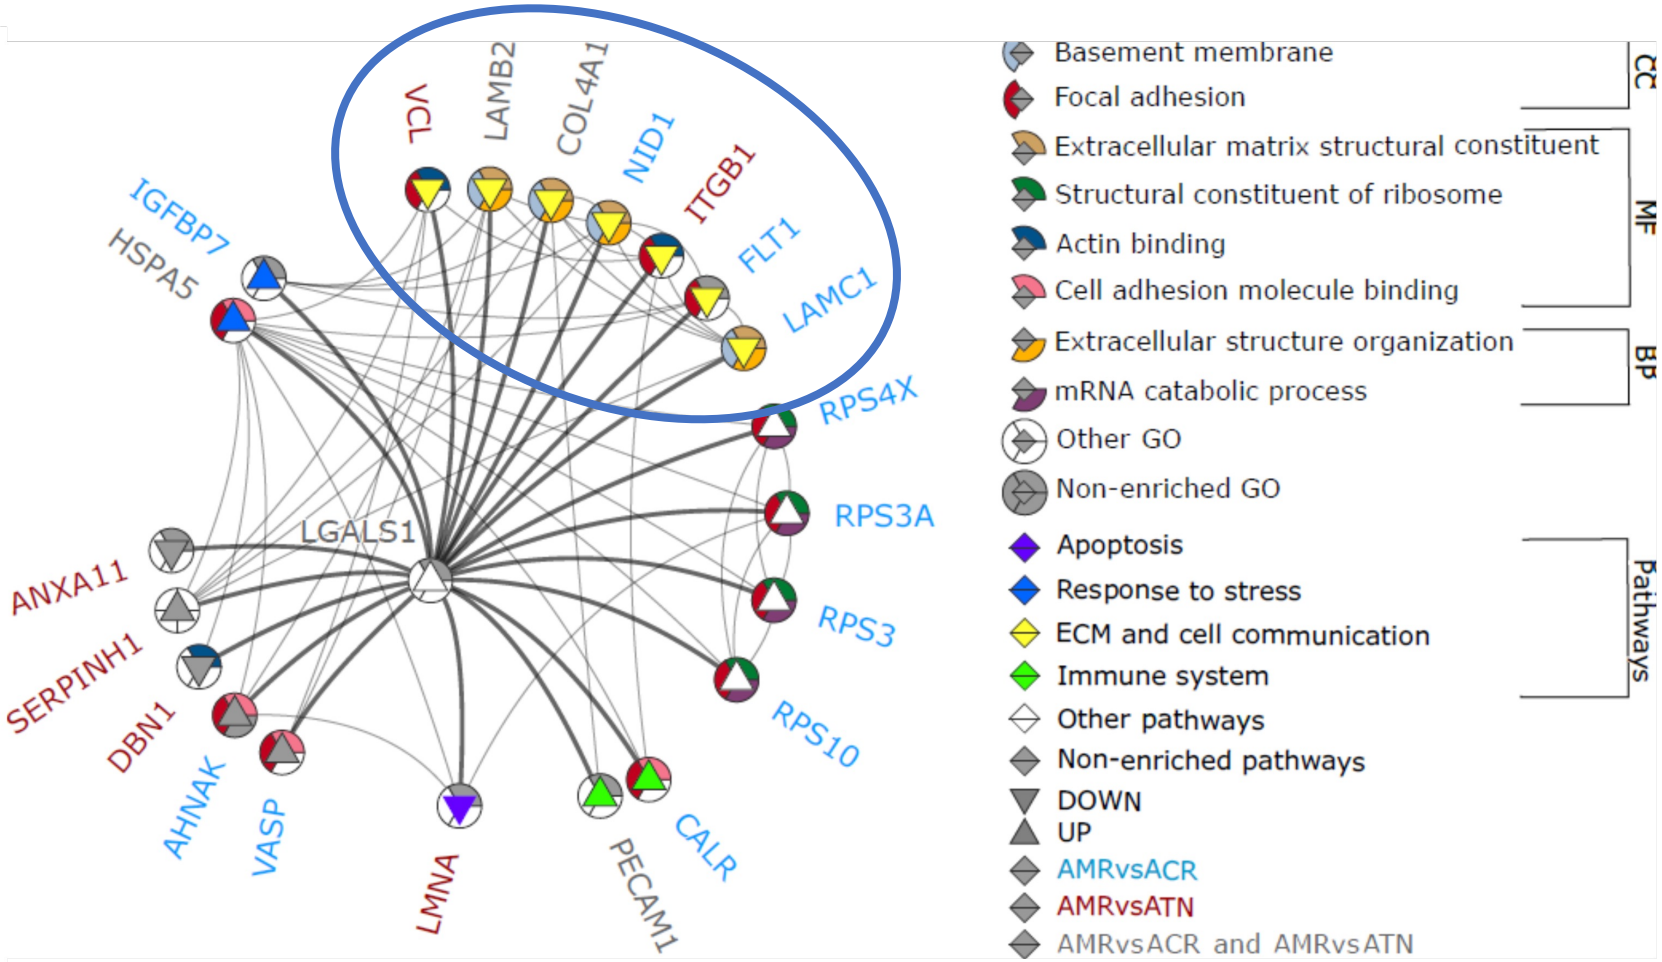
Dr. Igor Jurisica

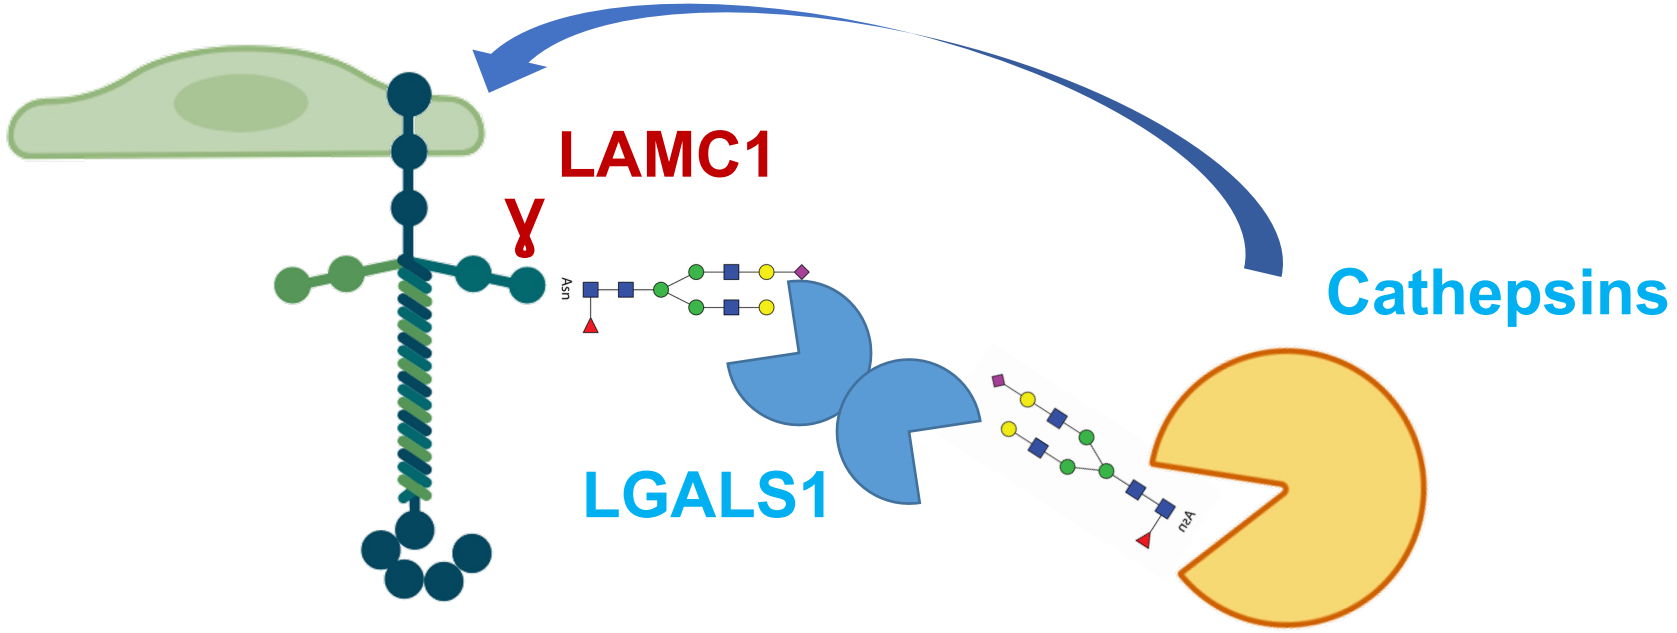


Clotet-Freixas S, *et al.*, *JASN*, 2020

UHN Ajmera Transplant Centre

LGALS1: An interesting protein

- **Interacts with the ECM** by recognizing β-galactose sugar moieties of proteins such as laminin and fibronectin (Ilarregui, *et al*., *Annals of the Rheumatic Diseases*, 2005).
- **Interacts with cathepsins**, which in turn induce its production in endothelial cells (Pranjol, *et al*., *J Transl Med*, 2019).



- **Remodels endothelium** to prevent migration of T cells into the tumor microenvironment (Nambiar, *et al*., *J Clin Invest*, 2019 and He et al. *Lab Invest* 2006).

Where is LGALS1 Expressed in the Healthy Human Kidney?

PERITUBULAR CAPIILLARY WITH PROXIMAL TUBULE

Rajasekar, *et al.*, *Lab on a Chip*, 2022

CONCLUSIONS

- We have identified common and compartment-specific changes in the basement membrane proteins in the absence of transplant glomerulopathy
- LGALS1 may be a potential therapeutic target as it communicates with the basement membrane proteins and immune cells and can modify inflammation
- Novel models to study AMR in peritubular or glomerular capillary bed will enable us to integrate immune cells with endothelial cells and to perform drug screening

Gaps in knowledge

- The role of kidney tissue in antibody mediated rejection is poorly understood
- The most important non-HLA antibodies to be included in routine clinical monitoring are unknown
- Determination of pathogenic DSA is elusive
- Effective therapies are lacking
